GP L90D ANALYSIS

Revolut GP L90D: root causes and path to £4M

The team tracks GP L90D as its primary metric. The objective is a £4M increase in 6 to 12 months. This analysis identifies what is driving the decline and sizes eight interventions to close the gap.

£7.67M
GP LAST 90 DAYS
191,412 users, May to Jul 2024

−£403K
THREE-MONTH DECLINE
Accelerating: −£77K, then −£326K

8
INTERVENTIONS SIZED
£1.95M to £3.15M total

£4M
TARGET
Achievable across three horizons

THREE MOVES THAT CAPTURE 70% OF THE TOTAL

1. **Restructure the vending machine campaign** to fix its reward economics. Largest cost at £2.8M per L90D. Worth £800K to £1.2M.
2. **Complete the card payment vendor migration.** Already delivering £331K in savings, with more to come. Worth £350K to £550K.
3. **Scale eSIM distribution.** Revenue grew 8.5x in three months on minimal spend. Worth £250K to £450K.

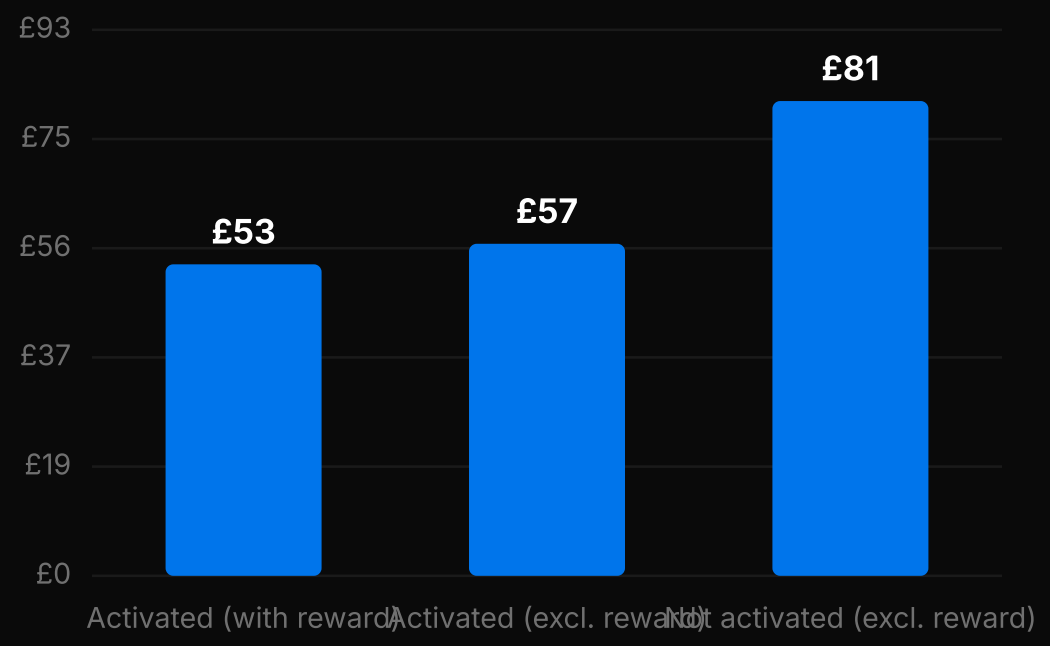
GP fell £403K in three months, with the decline accelerating in July

Interest income and FX revenue account for most of the drop, partially offset by lifestyle growth and lower card processing costs.

Source: 196,187 user-level P&L records. Amounts converted from £1,000s per documentation. April excluded (partial month, 7 days).

Restructuring the vending machine campaign can recover £800K to £1.2M

Initiative 6 cost £2.8M over 90 days. 6,455 users incurred card production and onboarding costs without ever activating.



Excluding the reward, non-activated users generate £81 per user

Higher than the £57 from activated users. The reward structure creates the loss. Costs hit before activation, so users who never spend £20 represent sunk cost.

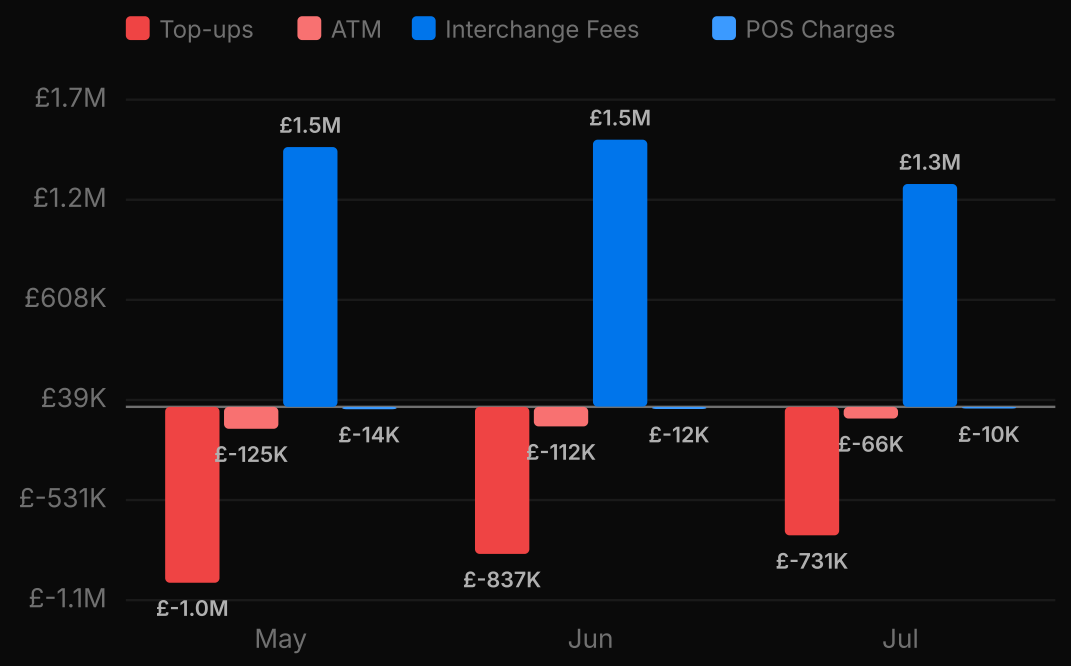
What to do

Introduce a qualification gate before dispatching physical cards. Cap monthly spend at £500K (trending there naturally). Track activation rates by channel.

£800K to £1.2M improvement

Completing the card vendor migration adds £350K to £550K. Savings are already flowing.

Initiative 8 introduced new cost structures. The data confirms material savings, with the transition still incomplete.



£331K saved in 90 days

Top-up processing: **+£269K** | ATM: **+£59K** | POS: **+£3K**

Costs still declining month over month. More savings ahead as remaining volume shifts to new pricing.

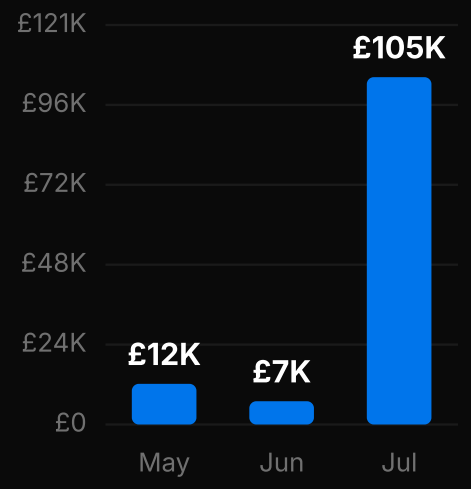
Card production costs are moving the wrong way

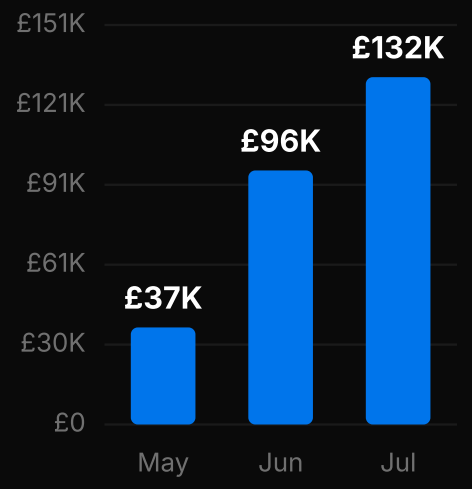
The new single vendor (Initiative 9) increased costs from −£99K to −£137K per month. This £38K increase needs an immediate commercial review.

Recovery target: £100K to £150K

Scaling eSIMs and RevPoints targets £350K to £630K, with strong early signals

Two lifestyle products show enough momentum to warrant deliberate investment.





eSIMs: £12K to £105K in three months

8.5x growth. Only 9 transactions in the dataset, so this is very early. Expanding to business travellers and targeting peak travel could generate **£250K to £450K**.

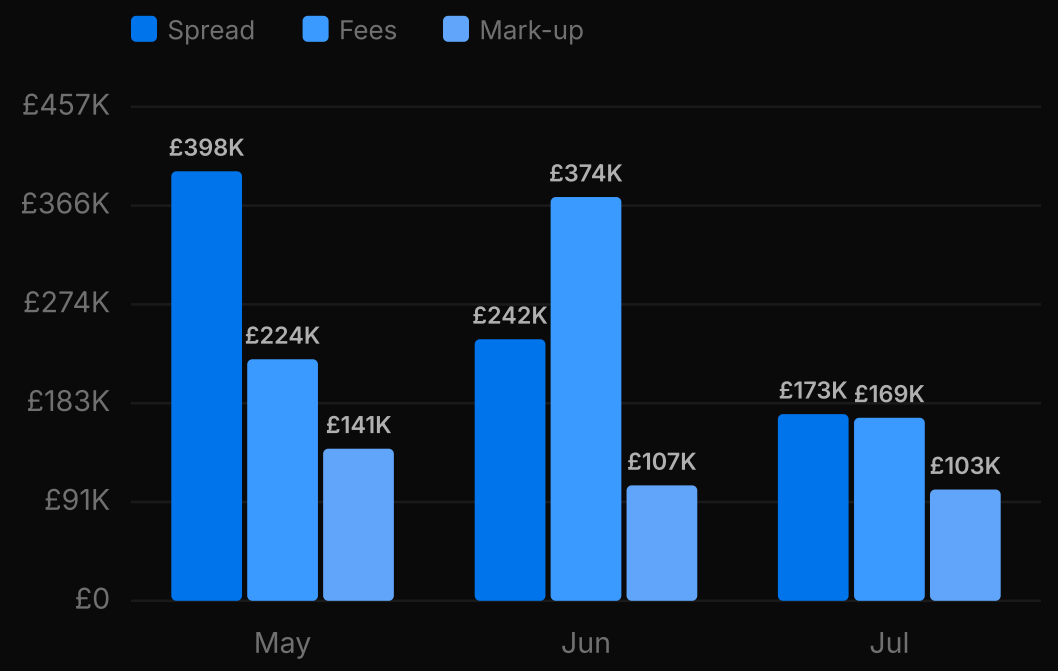
RevPoints: £37K to £132K, no promotional spend

3.6x organic growth. Expanding merchant partnerships is the natural next step. **Target: £100K to £180K.**

Stays (Initiative 4): launched in July with £15K. The 30% cashback reduction should improve unit economics. Too early to size.

FX spread pricing review could recover £200K to £350K of the steepest revenue decline

Three revenue lines declined a combined £713K. FX spread is the most controllable.



FX spread: down 57%, from £398K to £173K

Steepest structural decline in the dataset. Likely competitive pricing pressure or a shift in currency mix. A review by currency pair and plan tier is the next step. **Recoverable: £200K to £350K.**

Interest income on cash: down £373K

Cash at banks fell £215K, other financial assets fell £176K. Largely driven by external rate conditions. Balance optimisation could offset some of the decline.

Interchange fees: down £210K. Seasonal or structural. Worth monitoring but lower controllability.

Three smaller interventions add £250K to £420K

Credit repricing, card production fix, and subscription upgrades each contribute meaningfully to the total.

Selective credit repricing: £80K to £150K

Rate cuts (Initiative 1) reduced loan income in Romania (−£13K), Germany (−£7K), and Lithuania (−£11K). Germany further impacted by doubled provisions (Initiative 16, 5% to 10%). Not all cuts need to persist. Some markets may support higher rates without volume loss.

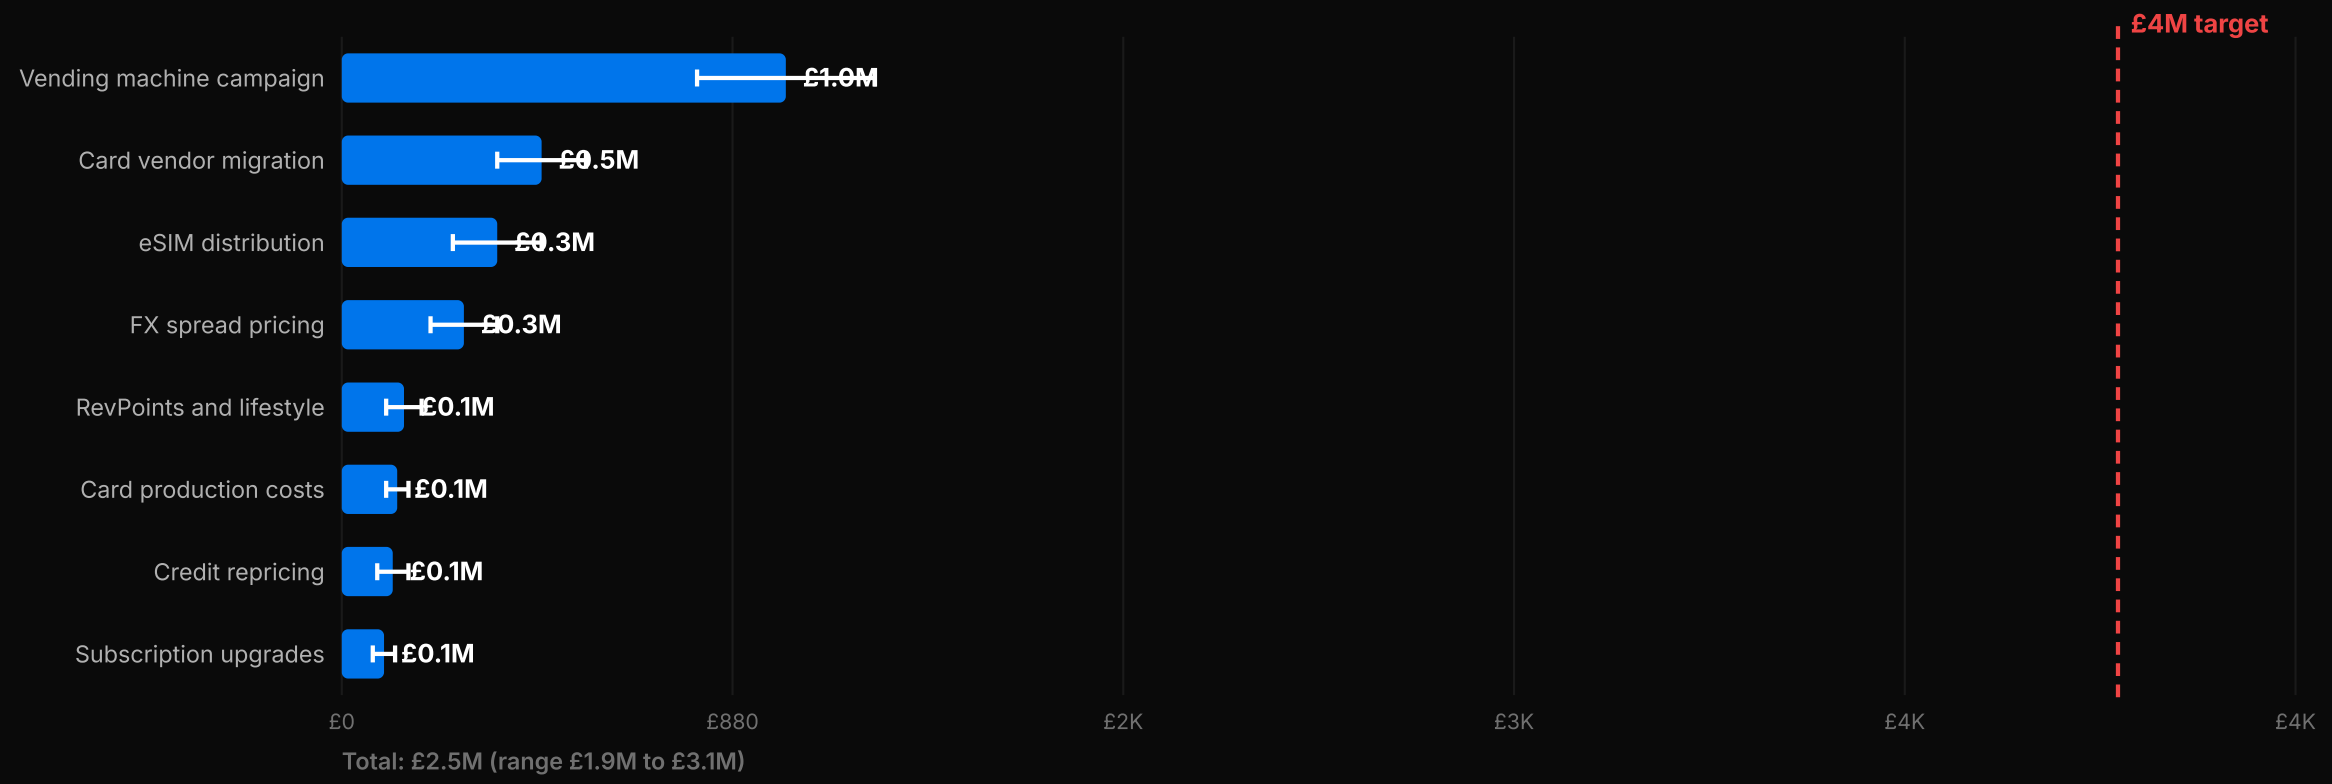
Fix card production costs: £100K to £150K

The new single vendor (Initiative 9) was supposed to reduce costs through consolidation. Instead, costs rose from −£99K to −£137K per month. Either renegotiate or consider reverting for part of the volume.

Subscription upgrades: £70K to £120K

Ultra users generate £232 GP/user. Standard users generate £15. Converting 5% of Standard to Plus (roughly 5,600 users) adds £28/user = £155K at zero acquisition cost. Business users at £913 GP/user are even more valuable but the base is small (2,348 users).

Eight interventions total £1.95M to £3.15M. Supplementary plays close the gap to £4M.



To reach **£4M**: execute all eight at the high end, plus grow the business segment (Scale plan has 172 users at £2,961 GP each), improve geographic ARPU in core EU markets (France, Romania, Poland at £18 to £32/user vs UK at £90), and refine bank payments pricing.

The first £1.5M can be captured within 90 days through four immediate actions

Now: four immediate actions, ~£1.5M

- Restructure vending machine eligibility and cap spend
- Complete card vendor cost migration across all card types
- Open commercial review with card production vendor
- Run FX spread pricing review by currency pair and plan

3 to 6 months: scale and convert, ~£1.0M

- Scale eSIM distribution with travel-season marketing
- Expand RevPoints merchant partnerships
- Run Standard-to-Plus subscription upgrade campaign

6 to 12 months: structural, ~£1.5M+

- Credit repricing by market based on competitive analysis
- Grow business segment via Scale plan and terminal rollout
- Localised pricing in top EU markets to close the ARPU gap

The first horizon captures roughly 40% of the £4M target. The highest-confidence interventions require no new investment, just operational decisions.

Assumptions and initiative mapping

KEY ASSUMPTIONS

amount_gbp is denominated in thousands as stated in the documentation

April covers only 7 days (24th to 30th) and is excluded from trend analysis

NAP status represents the final activation outcome during the 90-day window

All figures derived exclusively from the provided dataset

Recommendations assume current product mix and no major regulatory changes

Vending machine savings assume partial restructuring, not full wind-down

INITIATIVE MAPPING

#1 Credit rate cuts (RO, DE, LT): loan interest decline, slide 7

#3 eSIM launch: 8.5x revenue growth, slide 5

#4 Stays cashback reduction: £15K first month, slide 5

#6 Vending machine campaign: £2.8M cost, slide 3

#8 Card vendor cost changes: £331K savings, slide 4

#9 New card production vendor: £38K cost increase, slide 4

#16 German loan provisions 5% to 10%: compounds credit decline, slide 7
